

Deny All extends lead in WAF Market with the launch of rWeb 3.8 Software and Appliance platform

Paris, January 7, 2009 – Deny All, the technology leader in Web Application Firewall (WAF), today announced the launch of the new version 3.8 of its “flagship” rWeb software, which extends the Deny All lead in delivering to its customers the best level of security and performance for the broad range of web applications.

With the introduction of rWeb 3.8, Deny All provides the tools for a customer to fulfil the requirements for PCI DSS compliance with the most comprehensive set of security options. The performance also is taken care with more optimization brought within the acceleration and security features.

Deny All continues to innovate in technologies that directly secure enterprise data.

To help customers reach the optimal safety level for their applications, black-list model has been improved to be now group based. With the richness of more than 10 years of production in their signature files, checking all rules had become quite a performance challenge. With the group based model, now a request is verified only with the appropriate signatures group, making the transaction assured and quicker.

Gray-list mechanism, also called Deny All’s “scoring list” takes advantage of these new developments. Now rWeb 3.8 provides the capability to calculate automatically the reference weights for an application based on both the internal knowledge file and the specific logs of the application. The result of this calculation is a reference scale matching exactly the application behaviour, avoiding false positives and protecting against request which do not exactly match expected behaviour.

For the positive security model, white-list forms have been optimized, with the introduction of a new filtering rule which supports a large number of parameters, making it possible to define sets of authorized parameters and values in a single interface.

rWeb 3.8 also extends the possibilities to seamlessly integrate within customer architecture in transparent mode with no modification required to the existing infrastructure.

rWeb 3.8 is generally available now from 12 380€ and at no additional cost to customers with an appropriate maintenance and support agreement.

About Deny All

Deny All is the European Leader for Web, XML and FTP application firewall solutions. Deny All delivers proven solutions to major organisations worldwide, across all market sectors. The product range, available in the form of software and appliances, ensures protection, authentication and acceleration of Internet, extranet and intranet transactions.

Deny All’s easy-to-install solutions guarantee the highest level of protection against known and unknown attacks present in HTTP(S), SOAP/XML and FTP(S) data streams. Developed initially to meet the critical demands of the banking sector, Deny All’s products bring the experience of over 10 years’ production and innovation. Today, rWeb implementations protect more than 8,000 web applications around the world.

Deny All’s headquarters are based in Paris with European offices in Germany, Nordics, Spain and Benelux and active partners across Europe and systems installed worldwide.

Deny All is a privately-owned company, with major investors being Crédit Agricole Private Equity and Truffle Ventures. Deny All is a member of SAP Global Security Alliance, Liberty Alliance, OSSIR and OWASP.
